

# Statistical learning – hastie and tibshirani

**ASSIGN  
BUSTER**

Statistical Learning Model:  $Y = f(X) + \epsilon$  What can a good  $f$  do- Predict

- Help understand which variables are relevant
- How each feature  $X_i$  affects target  $Y$

ON STATISTICAL LEARNING - HASTIE & TIBSHIRANI SPECIFICALLY FOR YOU FOR ONLY \$13.90/PAGE Order

Now Regression Function- Ideal function: one that minimizes some loss func, e. g. MSE

- Turns out to be  $f(x) = E(Y | X)$  or average
  - optimizes MSE (mean squared error)
- Nearest Nbr Averaging To account for  $x$  without any observations, we can relax  $f(x) = E(Y | X)$  to  $f(x) = E[Y | X \text{ in } N(x)]$  where  $N$  denoted neighborhood

Curse of dimensionality Reducible vs Irreducible Error

$E[(Y - f'(X))^2 | X = x] = [f'(x) - f(x)]^2 + \text{Var}(\epsilon)$  Model

Tradeoffs- Prediction accuracy vs interpretability

- under-fit vs over-fit
  - Simple Model vs Black Box
- Bias vs Variance tradeoff  $E[y_0 - f'(x_0)]^2 = \text{bias}(f') + \text{var}(f') + \text{var}(\epsilon)$

Classification Problem Model classifier  $C(x)$  to predict class for  $x$  where class is in  $\{1, 2, \dots, L\}$  - i. e.  $L$  classes

conditional class probabilities  $p_i(x) = \Pr(Y = i | X = x)$ ,  $i = 1, 2, \dots, L$  Bayes Optimal Classifier  $C(x) = \text{argmax}_{\{i \text{ in } 1, 2, \dots, L\}} p_i(x)$  KNN (K-nearest neighbors) Equipped

Misclassification error  $\text{Err}_{\text{Test}} = \text{mean}_{\{i \text{ in Test}\}} I[y_i \neq C'(x_i)]$
