

How different aspects  
of development can  
affect one another.  
task 1. 1-2

They might have a learning disability, or, a problem at home which may affect their area such as reading and math skills, language, and behavioral/emotional development, regular teachers (and at least one special education teachers if applicable), and you may still be able to provide help for him in other ways, like hiring a tutor . Disability and sensory impairment, for example loss of sight or hearing, can delay development in some children. This is because an essential part of the whole picture of development may be missing.

If you think about how important hearing speech is before a child can talk, it is not surprising that communication skills may be delayed. Multi-agency child development centres work with children who have some form of disability to help to promote their development. PHYSICAL DISABILITY A child can intellectually be smart as in good with math and anything that includes thought processing but if the child has a physical disability it would be hard for them to apply this because they won't be able to balance or may have a delay when sending signals to the body, however, a lot of times children get frustrated when they can't do something because they have a physical disability and this can affect their intellectual development because it makes the child feel less confident. imagine knowing something and knowing how to do it but not being able to apply it or control it. This in turn would make them emotionally frustrated, angry and sad at the things they are unable to do which all their friends are doing.

SPEECH PROBLEMS Speech delay may in turn affect their social development as they may find hard to interact with others who don't understand what they are saying and unable to communicate and then the lack of confidence

follow on into adult hood etc VISUAL IMPAIRED Their fine motor skills would be limited, their language skills would be delayed. They would be lacking socially and this in turn would lead to them being emotionally angry as well as frustrated and moody as they are limited in the things they would like to do. A child with ADHD who has a mental difficulty would also suffer a language, social and behavioural difficulty which is associated with their condition, as those with DISLEXIA also have a learning disability which in turn generates low self esteem as well as making them frustrated as they cannot learn as fast as their friends which also makes them worry as well as making them withdrawn and angry.
