

# Transportation in bambui cameroon

Engineering

Transportation in Bambui Cameroon Planning and construction projects affect several interests and parties. However, the fundamental objective of such projects is to introduce positive values in the target area. Road construction in Bambui, Cameroon aims at improving communication, transportation, and increasing the standard of living in the region (Neba, 2009). Nonetheless, various adverse effects that result from the same include displacement of people to pave a way for the construction. In a transport construction project, there are several stakeholders such as the government, the local community, the constructors, and the employees of the building company.

Role

Expectation

The Government

Financing the construction project

To assess the quality of the road

Reimburse the displaced households (Neba, 2009)

Cooperation from the local community

The road will meet the estimated quality

A timely completion of the project

The Local Community

Provide manual labor to the construction firm

Support the government by collaborating with its demands

Support the construction firm by providing necessary information about the local culture and values to avoid conflict (Kiteh, 2011)

Provide translation services where necessary

To receive compensation from the government for construction land

<https://assignbuster.com/transportation-in-bambui-cameroon/>

Obtain employment opportunities from the company (Olander, 2006)

Have better roads for transportation of agricultural produce (Neba, 2009)

Construction of better and durable roads

Empowerment to sustain the project

The Construction firm

To build the road in regard to the required standards

Complete the project within the given time and budget (Olander, 2006)

To safeguard the welfares of the local by observing and respecting the local culture

Support from the government

Support from the local community (Olander, 2006)

A timely completion of the road

To stick with the resource and budget constraints

Employees

To provide the required skills and competence for the construction

To abide by the company rules and regulation

To avoid and report any instances of malpractices in order to improve performance (Olander, 2006)

Fair compensation system

State protection from exploitation

Career growth and development

Good working conditions (Neba, 2009)

In the transport construction project, the client or the local community in Bambui, Cameroon needs better roads to facilitate communication and transportation of their agricultural produce. Specifically, since the area has favorable climate to support agriculture and participates in intensive farming

practices, the current road network is a major hindrance to the transportation of these goods to the market. For this reason, the economic position of the community is weak, compared to other parts of the country (Kiteh, 2011). The local community looks forward to the completion of the project so that they can have an efficient transport and communication system that enhance the transportation of their farm produce as well as expose the region to external traders who come for the produce of the farms.
