Overall, how would you rate the program content in the Bachelor of Science

in Psychology?

Poor

Excellent

Comments on the strengths of the BSP program:

Comments on the potential areas of improvement in the BSP program:

Bottom of Form

I would give the whole program an average rating as it tries to cupture all the outcomes of the program. Well, I believe the program is not 100% excellent and at some points more need to be done to conform to the rapidily changing times. The program enables me to address problems emanating from human behavior by taking a historical insight of human development from the past to the current times and its influence on individual or group behavior. By cognitive psychology, I'm able to to understand issues like perceptions, attention, language, problem solving , memory and language which are fundermental when conducting researches and evaluating psychology based theories and research results. Statistical reasoning course enables me to embrace creative and critical thinking as statistical figures give more sence than words. Biological foundations has enabled me develop scientific approach to theories, research results, problems and issues related to human behavior. It gives an understanding of the physiological mechanism of behavior. But from the program, little emphasis is placed on scientiphic methods to psychology.

By studyind social psychology enables me understand the concept around

social life and also the impact of human thoughts, feelings and the impact of other persons actions. Organizational psychology equips me skills related to psychological principles and their application in a work environment, that is, on things like legal issues, selection of employees training, performance appraisal and group behavior. Diversity and cultural aspects in psychology enables me to me have a wider frame of reference with respect to human diversity and apply the knowledge to counceling and psychology based research. With this understanding of diversity, I'm able to practice respect for social-cultural iversity on both local and global scales.

Apart from the little emphasis on the scientific approach to psychology, I feel the program is generally effective in empowering my understanding of psychology, its theories and application in real life. More effort should be applied on developing scientific approach to psychology since science is more factual and provable practically than any other approach.
