

Environmental pollution assignment

**ASSIGN
BUSTER**

The cause of the growing population has led to a high density of factories, automobiles, and commercial enterprises in Los Angeles. The population growth is beginning to create many environmental problems that are giving Los Angeles economic, and environmental consequences. Theresa Carter, an associate-level environmental scientist, has suggested four measurements of the city council for addressing the pollution management. She has suggested to Encouraging alternative transportation, walking, and bicycle use, Promoting fuel-efficient cars, Improving roads, and Encouraging carpooling.

The encouragement of alternative transportation is great on the earth environment and the health of human beings. The improvement of better roads can also improve the transportation of people, reduce car accidents, and can allow people to compost what was used. Compost helps improve soil, so it holds more water and plants grow better. Carpooling is a very effective climate change, because it allows one car to be used to carry different people to work and other places.

For instance, eight people wanted to drive their car from Los Angeles to Apple valley. Los Angeles is an hour and a half drive away. Instead of using eight different cars and spending money on eight different fossil fuels to fuel their cars, one person can use a van to carry all the co-workers to one location saving hundreds of dollars and used of savable fossil fuels. When people use walking, bicycling, and carpooling at least twice a week it can cut the greenhouse gas emission at 1,600 pounds per year.

The promotion of fuel efficient vehicles allows the waste of fuel not to be used and helps protect the future cost of fossil fuels. When humans trade a

car for a bicyclist it does not only improve their and the ecosystem health, it allows humans to fight obesity and rely on other ways to get around. Some persons may argue that fuel efficient cars are a great expense, but it can also be a significant improvement to get their health in order. It can do this by removing pollution from the air and gathering into their lungs.

Bicycling is exercise, and many people have become obese by sitting around and driving, while not doing anything to benefit their health. Pedestrian crashes are more than twice as likely to occur in areas without ideals; streets with “sidewalks on both sides have the fewest crashes.” Streets without safe places to walk, cross, catch a bus, or bicycle put people at risk. Over 5,000 pedestrians and bicyclists died on U. S. Roads in 2008, and more than 120,000 were injured” (Reynolds, C, p. 22, 2009).

Improvements of new roads and fuel efficient cars can be a massive expense, but there is an excellent conservation of people lives, and deter of greenhouse gases being released. Better decision making on environmental issues, allow people to make a better decision to live life on earth for a longer existence. The way the Earth works is to create and recreate, not for human to produce and destroys nature natural habitat. The following quote “Decision-making about environmental issues necessitates the maintenance of a good balance between the effectiveness of measures and the public reaction towards them. In Theresa opinion mean that if human makes a valid decision on the thing that he or she find necessary, meaning something they can not live without Only then will they know how to keep the earth and its environment clean, and the general will began to follow. When the public sees the response of them destroying the environment personally, they can

take the appropriate measure it take to have others combined with the contribute to restoring and maintain a clean environment.

Los Angles economic and environmental hazard can become improved by encouraging alternative transportation, walking and bicycle use, promoting fuel-efficient cars, improving roads and encouraging carpooling. Many hazards come from the emission of fossil fuels from the engines of cars, by implementing the use of people not using their cars or making fuel efficient icicles, it helps improve the inconvenience use of vehicles.

When the growth of population becomes larger, more people require unnecessary materialistic items, like cars, technology, and material that cut into the field and push down trees from growing. Animals start to get pushed out their habitats, and the earth begin to become small on their environmental structure. If Los Angles complete or clean up their street, it may cost a profit, but it is a reduction in car accidents, better bicycling paths for bicyclist, and a cleaner environment so humans can respect and take care.
