An Erratum on

[Periodicity Pitch Perception](#)

by Klefenz, F., and Harczos, T. (2020). *Front. Neurosci.* 14: 486. doi: [10.3389/fnins.2020.00486](#)

Due to a production error, microseconds (μs) were erroneously changed to milliseconds (ms). A correction has been made to the *Results*, subsection *First Spike Latency (FSL)*, paragraph three:

“ First spike latencies are a linear function of the tone interval with the regression line given as $y = 1.0126x + 42.327$; $R^2 = 0.9997$. Interval durations and FSLs are nearly identical because of the slope 1.0126 of the regression line. This setting has a drastic impact and minimizes the mean standard deviation over C4 to C6 to 18.11 μs , which is an indicator for the high precision of the timers. From C4 until F5, except a single slight overlap {Db5, D5}, there is no overlap of the $\pm 2\sigma$ error bars so that tones are distinguishable with high fidelity at the 95% confidence level.”

Corrections have also been made to the *Results*, subsection *Stochastic Term Modeling*:

“ The adapted Aubie's model responds with a mean FSL SD derived from all intervals of 18.11 μs . To circumvent the CPU's time-consuming interval duration computation in NEURON, for every ISI we replace Aubie's model by formulating an equivalent stochastic computation input/output function with a Poisson distribution of $\pm 20\mu\text{s}$ and apply it to the test corpora. We take audio snippets with a length of 100 consecutive octopus spike intervals for a

<https://assignbuster.com/erratum-periodicity-pitch-perception/>

selected patch. For each interval, we compute a mean F0 for each patch. The computation of the weight of a patch is the same as in our previous article ([Harczos and Klefenz, 2018](#)).”

The publisher apologizes for this mistake. The original article has been updated.
