Whether it's early man's first use of fire or the birth of the spaceshuttle, innovations have always been the major catalysts behind humankind's success. Some of these breakthroughs brought about immediate change, while others humbly laid the groundwork for important developments down the road. It is impossible to explore how each new advanced technology has impacted our lives and how it will impact the future. Technology impacts the environment, people and the society as a whole. The way we use technology determines if its impacts are positive to the society or negative.

What innovations or invention(technology) had the biggest impact on civilization throughout history, and why? Think broadly and reflect on technologies that we cannot live without. The technology that you choose must be at least 100 years old or older. Consider how civilization has been affected by this technology over time. An elevator is the part of our civilization and it's one of the most popular old inventions of the 19th century. Elevator was invented in 1853, but before that, it existed in a different form. So most probably it is one of the oldest inventions of our society.

The invention of the elevator enabled a whole new type of architecture – and had a profound effect on our culture. The lift ascended with the rise of the tall buildings it made feasibly. Over the past 150 years, elevators have proliferated in a surprising number of guises. Although most became little more than functional boxes spun up and down dark shafts, others became spectacles in themselves.

Dubai's Burj Khalifa – the world's tallest building – has a lift that can reach speeds of up to 60km/h. Old people, patients, and even children can reach to any floor of the building without anyone's help. Elevators not only protect young children and adults who are frailer, it can help everyone stay safer. Having an elevator installed means that whatever service on offer is disabled and handicapped friendly. There are over 1, 000 deaths per year which result from people falling down stairs, particularly the elderly. An elevator helps to prevent this by giving those who are accident prone the opportunity to take a safer route to their destination.

You can't deny the benefits of the elevator in our lives over the years. It's a very important part of our life. Elevators completely change our lifestyle, whether we are in the home, at the office or at any other place, it's always there for us, for our safety. What innovations or inventions (technology) had the biggest impact on civilization within the past 100 years, and why? Exclude the obvious ones, such as computers, the internet, cell phones, automobiles, and airplanes. Consider how you personally and society have been affected by this technology over time.

More than a hundred years ago, the smartphone was invented in the form of a telephone. In the 20th century, society watched smartphones in a new shape, right after the invention of the computer and internet. In the late 90's, the smartphone was invented. Despite being lighter than a roll of quarters and occupying less space than a paperback book, the smartphone's role in shaping human interaction in the 21st century has been as dramatic as it is far-reaching. The smartphone is now a pocket-size PC. It facilitates instantaneous personal connections

that make phone conversations seem like cave paintings. The device seems to have limitless potential.

Living without a smartphone isn't easy. You have a torch in your smartphone. How can you text anyone without a smartphone. Can you take pictures of beautiful natural scenes? Can you order something online? Can you book your flight without even going to airport? Can you buy grocery without even going to market? Can you check your important mails from university and teachers? Today you can't do anything without your smartphone. It became the most important part of this generation as well as the part of our civilization. Our society changes from time to time. Human came into this world without anything in hands. At that time human needs nothing.

But now in 21st century, the same human can't live without all these things. Human invented all these things for easy, good and happy life. All these inventions help us a lot. Today's human very changes from the past one.

We are very soft people, we can't do hard work like they do in past, 1000 years ago. All because of these inventions. These inventions are completely changed our civilization.
