the earliest study on observational learning were performed by Edward L. Thorndike and showed that there was no evidence of such learning in animals. Learning is a relatively permanent change in behavior due to experience. In observational learning, this behavior change involves observing a model.

ONQUIZ 10 SPECIFICALLY FOR YOU FOR ONLY \$13.90/PAGE

Order Now according to the textbook reading, observational learning involves observing events and their consequences. Social observational learning may be defined as any change in behavior due to observing a model. When an observer learns from a model, the model is typically receiving operant conditioning. The tendency to imitate modeled behavior that is irrelevant for reinforcement is called overimitation.

Herbert and Harsh compared the behavior of cats that had observed a model perform an act 30 times with cats that had observed the model only 15 times. They found that those that observed 30 performances did substantially better than those that observed 15.

Research shows that whether children imitate an aggressive model's behavior depends on whether the model's behavior is reinforced or punished. According to the fully behaviorist view, observational learning is really a form of operant learning. Punishment of a model's behavior has _____ on the behavior of an observer. An impact which of the following is a characteristic of models that influences vicarious learning?

All of the above

Which of the following is associated with Bandura's theory of observational learning?

Attentional processes

Skinner maintained that reinforcement determines the _____ of a response; Bandura maintains that reinforcement determines only the _____ of a response.

Acquisition; performance

According to Bandura's approach, which of the following is not a basic process or ingredient of observational learning?

Response absence

minded professor pickering.... operant conditioning researchers found that college students imitated the reinforced word choices of models. they mentioned more nouns than a control group. in their study the observers listened to models on an audio tape in their study of observational learning fisher and harris found that if a model wore an eye patch, then observers learned more from the models behavior studies of " asocial" observational learning often use a ____ condition. ghost who is the most likely observer to learn from the observation of a modeled behavior? an observer who can attend to and retain the observed event in memory and reproduce it according to lecture, the phenomenon known as generalized imitation is the tendency to imitate modeled behavior from reading the text we learn that the operant learning theory of observational learning takes the ____ approach natural science in banduras theory of vicarious learning, steps taken by the observer to improve later recall of a models behavior are called retentional processes
