Introduction.

Over recent past the change in climate has become a big problem as it is resulted to change in climate system. This has risen concern to environmentalists and people associating it to activities of human. The recent human activities like deforestation, advances of technology, pollution by gases and nature activities. Because of adding climate change effects. Scientists are working to explain causes, present and future of climate by usage of observing and theoretical models . Climate change has become a serious problem and human allover are concerned on how to reduce bad human activities causing it because it is said that climate change is determined by activity of human (Adam, 2009). This essay will discuss climate change and give ways to save it and recommendations.

Climate is different in parts of earth and also different in time. As now the leading cause of climate change is activity of human people, Activity of people like using fosil fuel in car, burning of coal, releasing green house gas like carbon (IV) oxide and methane in air and cutting tree increases climate

change. The current situation is very bad because activity by man is increasing daily because of technology and other things causing more climate change which in turn cause increase in global warming. Global warming increase temperature in earth causing earth to be hotter hence causing change in climatic patterns. Other factors causing change in temperature is volcanic eruption and change in sun. It also cause disaster like earthquake and tsunami. However the question of climate change is no longer if it is real but how to change it but many people know it is serious and they are changing very fast. Also many scientific research is going on to explain climate change in deeper details . Next I will discuss problem that climate change come with when it comes.

Problems.

Like paragraph before, we discuss what climate change affect. First climate changes affect physical, human and biology systems. First I discuss Physical impacts. For few years passed we have experienced allot of earthquakes, rise in sea level, oxygen depletion, extreme weather , tsunamis and many others. Physical impact like shown above affect human life, like earthquake usually cause dying of people or it can destroy properties like house, this has extremely affected the economy since economy boosting structures like roads and industries is destroyed. Global warming is increase in temperature of earth melt ice and this has been reflected by rising of sea heights. This causes serious thing like disappearance of glacier parks, coast line submerging into sea, sinking of islands and also increase it temperature has also killed people by heat waves. Extreme climate can bring tropical cyclones and floods.

On humans and biology system climate change has caused rapid evaporation due to addition of heat hence making water to disappear and become scarce in future (Mcintyre, 2012). Precious water used for drinking, for fish and irrigation will soon be lost. This means that fish will die and plants will die since the land will become more dry. Increase in the level of greenhouse gases brings the greenhouse effect and also many carbon dioxide gases in the air can result in development of respiratory problems hence causing the dying of man. Things like earthquakes can destroy roads creating traffic problems and many others more.

Solutions

The problems are influencing humans seriously and need to be quickly looked at. In this section I discuss solutions because it is a serious problem and many humans are getting worried about it. Many countries are working to reduce climate change as soon as possible like USA, UK and China have innovations to reduce pollution. Though every country is adopting measures to remove climate changes. Most cause is related to human activities but people are still investigating other sources (Goldenbery, 2013), US is open to drastic measures of saving environment (Holdren, 2010). Global warming is caused by rise in temperature, so temperature regulation is important in climate change. Adopting methods to reduce carbon (IV) oxide in the air is a must. This can be gotten by reducing burning of fossil fuels in the air, reducing the greenhouse effect and reducing the burning of polythene bags. Because with regular temperature animals have good life, people are comfortable and plants grow bigger. Another way to solve climate change is to reduce pollutions. Sources of air pollution may include factory gases, exhaust gases and other things. These gases

accumulate in air causing a rising in temperatures because heat cannot be lost to the atmosphere. Hence this causes a lot of pollution and climate change. This can be aided by putting policy on pollution or good technology affecting not the climate. Good machine will help people work easy and don't pollution.

All the above solution is good and can be recommended because it saves time and environment. The big problem is making public awareness on the bad climate change and making human to change bad activities to good one. This process may take years for implementation, however humans need to take the responsibility of saving the environment by adopting good practices that don't interfere with the climate or disturbing the balance of nature. Saving environment comes with economic details like selling cars that pollute or shutting factory that emits harmful gas thus all these must be considered before making any move and healthy decisions made. But the big challenge remains to be cooperation of humans.

Conclusion

In conclusion, Climate change being an international problem is a vice that poses many problems to humans in the world and therefore calling to be addressed effectively and immediately. From the above essay, we have discussed the problems brought about by climate change which have an effect to our humans, animals and environment. Climate change is therefore a biggest issue on which measures need to be adopted in order to curb its adverse effects. It is however not an easy task to control this but with good regulation of industry waste like bad smoke and support from all human with more devotion and patience will see through this change.
