Animal rights
Pros and cons of animal experiments
Personally I don't think that there are many pros about this subject, but I've written down a few.

Pros: There are vaccines for most of the diseases. Like the ones you'll receive when you're an infant, which are very important. If you have a deadly disease, like cancer for example, you can prolong your life for years, if you discover it early enough. Thanks to the science and research with animals. In some cases you can also help sick animals by doing tests on them.

In my opinion there are more cons. To some extent I do agree with animal activists when they say that "we" kill the animals for no reason whatsoever, but at the same time I don't think they realize that it's thanks to this that many of them are alive today. This is what I think. Cons: They do many unnecessary tests over and over even though it already exists workable vaccines. Then they simply make the animals suffer. Why do certain when they know that animals react differently from humans?

Some doctors only do the tests to rise in their position, to get better paid. They would go so far as giving the monkeys a cigarette, to get cancer, just so they can do tests on it! Some of the medicines aren't even legal or at least not recognized by WHO. So they have done some painful and cruel tests on the animals for their own gain. Cosmetics that are tested on animals don't have to be done. They're not the ones who will use it in the end anyway, test it on us humans instead! Or is the makeup ingredients so dangerous that you get permanently damaged?
