

# Ethical issue essay

[Sociology](#), [Ethics](#)

As a supporter of the idea, genetically modified babies will not only improve newborn children's health from diseases, but also have the specifications to change certain features of the child. Modifying babies sounds like such a far-fetched futuristic idea, when in reality, today is the future.

The technology is all here, and if we don't utilize these advancements now while we have them, we may never get a chance to do so. With the practice of genetically modified babies, life will improve for the future.

Genetically Modified Babies will improve human health and prevent many diseases. With much conducted research and such little testing, the scientific community states that "genetic screening on embryos has potential to wipe out genetic disease by virtually removing the alleles from such disorders. When it is used in correct form[...] children born in the future will have the potential to be purely "healthy" and carry no signs of genetic disease. With the use of genetic screening, diseases caused by mutated genes or family passed genes could be cured.

Disorders like Down syndrome, Color blindness, sickle cell disease, cystic fibrosis, and Tay-Sachs disease could all be cured and stopped, by using genetic screening. With Designer Babies, families will have a benefit in the family health line from each generation. Families would also have better reproduction of healthier offspring because of it. With the practice of genetically modified babies, life will improve for the future. With using the technology that comes from Genetically Modified Babies, these newborns will be more improved and advanced over time.

Eventually, these babies will be more smarter and intellectually intelligent than naturally babies. It is estimated that the new genetically modified babies will live close to 20 years longer than us. Some crazy phenol eons state that unethically modified babies will lead to a new "super human" breed of living organisms. There is nothing wrong "[...]with the attempt to make our children smarter or kinder," Steinbeck told LiveScience. 'If we did think that was wrong, we should give up parenting, and put them out on the street. "(Steinbeck) No parent would ever leave their child out on the street, especially if they were more smarter and kinder than a regular newborn. With the practice of genetically modified babies, life will improve for the future. How would the future look for Designer Babies? Well, there would be a regime of technological consumer eugenics, that would benefit society as a whole. If the FDA says yes to the practice, it would be the first time a government body has supported changes for humans and Amorals their ascending generations.

From my research, I've seen that the FDA committee is considering an okay in the scientific issues of the idea, however for such uses of emotion drill manipulation and "designer" babies they're still spectacle. With the practice of genetically modified babies, life will improve for the future. Genetically Modified Babies, will help prevent genetic diseases and make a great future for the world. However, there is a lot of down faults. What if there is a small function in the medical process of genetic engineering, also in the designer babies process the child can come out wrong or not how the parent wanted it.

Another detriment to genetically modified babies is that these absurd theories could be true and cause humans to be inferior to those babies, once their race grows and develops with time. Let's look at the facts here, Genetically modified babies, are good for stopping genetic mutations and providing health, the offspring will improve, and it will create a new future towards life on this planet. Many people disagree, but I support the FDA in that they will decide to use this practice everywhere and utilize this country technology.

Genetically modified babies will increase health of the world and also bring new scientific and medical advancements. Diseases that are killing people now, will be wiped out of the human race if we had genetic engineering in years to come. As a society, we are forced to do the most best thing for us, and as humans we learn that "new" is better. Once we start advancing and tinkering with technology, we're like that it can help us with survival and the human condition on this planet.
