Concerns about Research Methods 27 AUG The Concerns about Research Methods The development of nursing - from the catholic monks of the Dark Ages who provided care for the sick, to the nursing care provided by prisoners in the 17th century, to the dedicated services of the famous Florence Nightingale who is considered a 'ministering Angel' as she revolutionized the concept of nursing and to the development of nursing degrees and research courses in the modern era is in many ways one of the most dramatic revolutions in the history of the science. In numerous ways, nurses act as a backbone for the efficiency of other aides of health care profession due to their management role in researches in Universities as well as various health care settings.

I have been looking forward to this class on nursing research because of my impetus to generate and propagate the outcomes of this course for the betterment of the health care profession as well as for my own mental and intellectualistic growth. However, I think that I would like a course in nursing research methods better if more nurses came forward to enroll in research courses as that would have increased my interacting and communication skills. Secondly, it would have been appealing if more financial aid from the government was available for research courses. Qualitative research focuses on the principles of phenomenology as well as biological statistical methods and techniques, and I think that a class in nursing research will improve my effectiveness as a nurse. It will also help me in conducting a lot of interviews to study human consciousness, tabulating the results I receive, analyzing numerous case studies and mastering ethnography. I will be studying diverse human cultures and recording the results which will definitely increase my

efficiency as a nurse. Inevitably, I will be a more effective nurse once this research course ends. Furthermore, the research course will improve my knowledge of scientific methods used for clinical practice, enhance my ability to recognize the symptoms of diseases and provide effective palliative care (Sirotnik 2006)
