

Smoking

[Linguistics](#), [English](#)

Smoking Tobacco in U. A. E The article by Al-Houqani, Raghieb, and Cother explores smoking as a public health issue in the U. A. E. these authors observe the use of Arabic traditional pipes have been on the rise, alongside smoking practices that involve different type of tobacco. In the U. A. E region, majority of smokers are men. On the same note, there are women who smoke, but the number of women is significantly low in that regard. As smoking practices rise in this region, there are critical health concerns about the entire U. A. E public. This is because smoking affects both smokers and nonsmokers as far as public health is concerned.

This article and all the insights presented in the text play an important role in explaining trends in smoking both within and outside the U. A. E region. The article observes the developments and transformations that have been triggered by Midwakh, an Arabic traditional pipe. These developments encompass cigars and shisha. The consideration of smoking patterns, trends, and practices from elsewhere around the globe makes this text credible for research purposes. It compares smoking in the U. A. E with the rest of the world.

Finally, the information presented in the article is relevant to the final paper topic of discussion. The essence of research in the final paper is to capture significant aspects that shed light on smoking practices in the U. A. E. this text captures both men and women, and further highlights demographic factors that enhance the completeness of the final paper. In this respect, the ultimate plan is to use this article to understand the dynamics of smoking within and across the U. A. E.
