

# Common of software that tiene como objective to infiltrate

[Business](#), [Management](#)

Common signs of malicious software may include: • Unwanted URL redirections, • pop-up ads, • Altered search results with Google, • Adding toolbars in your browser, or unwanted sidebars, • Low speed.

A computer virus is a malware that is intended to alter the normal functioning of the computer, without the permission or knowledge of the user. A virus, usually, replaces executable files by other infected with this code. The viruses can intentionally destroy the data stored on a computer, although there are also other more harmless ones, which are only characterized by being annoying. Malware (from the English malicious software), also called Badware, is a type of software that has the objective to infiltrate or damage a computer without the consent of its owner.

The term malware is widely used by professionals. Malicious software attempts to steal confidential information from a computer, send spam or commit fraud. This type of software often integrates free downloads without your knowledge. You may not know that your site carries or disseminates malicious software to users who access your site. This is because malicious software can be obtained by downloading templates from your site or in a code installed in various site applications.

What is malicious software? When large amounts of data are stored in electronic form, these are vulnerable to many types of threats. Its origin can be in technical factors, of organization and of the environment, combined with the bad management decisions.

Why are systems vulnerable? Information systems concentrate data in computer files, so automated data are more susceptible to destruction, fraud, error, and abuse.

When computer systems fail or do not work properly, lascompañías that depend heavily on them experience the serious loss of theirability to operate. System vulnerability and abuse.
