

Artificial intelligence critical

**ASSIGN
BUSTER**

Artificial Intelligence is the making of computers that think like a human - to be able to learn and to have new ideas. Artificial Intelligence is the current and will be the future era of computing. Researchers are creating systems and programs that could mimic human thoughts and try doing things that humans could do. The artificial intelligence is a combination of computer science, physiology and philosophy. Its aim is to make the world easily intelligent and accessible by anyone, especially by visually-impaired and physically-challenged persons.

The Artificial Intelligence has come a long way from the old days. It was with the invention of the computers that the Artificial Intelligence method began to maneuver researchers. The technology was finally available and seemed to stimulate intelligent behavior. Intelligent here means, things which could be done at a faster pace and thinking than a human mind. The insights and theory brought about the Artificial Intelligence will set a trend in the future. The current products are just the beginning of the future trend, for example: Gaming vs...

Computer and Voice Recognition. The Artificial intelligence research is highly technical and specialized. The research of the Artificial Intelligence is based on two main lines. One line is based on the biological thinking where the Artificial Intelligence is based on the idea of human talking and that system should work like how humans think. The second line is about phenomenal which is based on formalizing common sense and facts about the world. Somehow both the researches intersect and may succeed eventually.

With the input of Artificial Intelligence, it is expected that many of the problems, the machines are expected to solve and that would require an extensive knowledge of the world. A lot of knowledge in various aspects has to be acquired in attaining the knowledge for an AAA to function correctly. The prediction of the usage of Artificial Intelligence is vast. This is a common topic both in science fiction and projections about the future society and technology.

Some believe that with the onset of Artificial Intelligence, the progress of the country would be limited and some believe that since these could be replaced for various tasks that humans do, it may lead to unemployment too. No matter what, science has always progressed and explored various sectors, the Artificial Intelligence is one sector that has great potential and could mark a history to scientific studies in the future. Questions & Answers: In what way Artificial Intelligence helps visually-impaired and physically-challenged people?

Are there any requirements? Artificial Intelligence really plays a vital but basic role for helping both visually-impaired and physically-challenged people. It allows to communicate with the computer with their voice. A voice-enabled computer converts the words spoken by the person to a computer-understandable input, thus it will be easy for them to operate the computer, than using the usual mouse and keyboard input. Yes, but a few only. The first one is the equipment and the other is languages.

Computers need a microphone to record the voice and appropriate language programs to understand the human-spoken voice. Usually, Yes, since

Artificial Intelligence is implemented on computers, they are prone to viruses and can cause negative impact to the humankind and even turn against them if misused or affected by bad kind of programs likes viruses. That's why antivirus and cyber-security technologies are technologically improvised along with AAA at the same time. You said that Artificial Intelligence might lead to unemployment.

By what means it affects the social world? In the social point of view, Artificial Intelligence causes a negative impact on humans economy. If AAA causes unemployment of real literate human beings, it leads to social and man-power waste. Then, what will be the use of teaching and providing education to humans in the future? So, usage Artificial Intelligence in the future should be limited, so it can be quite good. Three questions are made up. Which is good can be taken into account.
