

# Future evolution of human beings philosophy essay

**ASSIGN  
BUSTER**

This paper discusses about future evolution of human beings and the future outcomes of the human beings. It also details the prospects of the human beings in future evolution. It describes the possible and the probable limitations of the future evolution of the human beings. It provides some reflects in the human evolution that impact in the culture of human being. It also proposes the details of human evolution in terms of scientific ways. It examines the human evolution with prediction methods. This paper concludes these concepts in regarding human evolution by giving the proper details.

### Future Evolution of Human Being

Human evolution is the one that is the evolutionary process to the appearance of modern or current humans in the world. The evolution of the human covers the evolutionary history of the primates especially the genus Homo and also the emergence of the Homo sapiens. The evolution of the human being involves physical anthropology, primatology, archaeology, and the genetics. It is characterized by the number of morphological, developmental, psychological and the behavioural modification that may be taken place because the separation between the last common ancestor of humans and chimpanzees. The most adoptions in the human evolutions are bipedalism, raising the brain size, gestation and infancy, reducing the sexual dimorphism. The modification of the morphology includes the evolution of a power and the precision group.

### Future prospects of human evolution

The human evolution will become powerful and the process of the human evolution will be successful in future. The main driving force is behind the human evolution is that the evolution will occur while the genetic mutation can be passed throughout the generation of the human being. But the human population is growing exponentially in the world then the isolation of the world does not exist. The population may become blurred as populations continue to merge in the world levels. In the case of natural selection, the expectations of the human evolution are to provide the greater immunity from the attacking diseases for the human being. This protection of the human evolution will make the fine balance between the life and the death nature in this world. In future, the human evolution will charge of their own evolution for promoting the desirable characteristics while discarding others. The human beings are essentially stuffed in the case of mixing the artificial selection and the sexual selection and because of the parents are concentrating their babies for getting full desirable traits in the case of physical traits and also the mental traits in the world. The physical traits and the mental traits include the effectiveness, height, muscularity and the energy levels. The growing the machine control is the one prospect of the human evolution in the world. The future of the human evolution will be lied with learning to transcend their biological limitations by utilizing the machine in the world.

The process of the Transhumanism could lead potentially to the creation of the super soldiers and also the super athletes who cheat in the case of death through immortality and through the super soldier's mind downloaded to the desktop. The machine also envisions evolution occurs just frequent as it does

naturally. But in the case artificial beings, the being can able to produce much faster than their old fashioned Homo sapiens in the world, this is the most prospect of the human evolution in future. The future hold of the human evolution will evolve through the utilization of the genetic engineering and the other technology.

It is also possible in the case human evolution will evolve through naturally. But due to the technological development the future holds of the human evolution in case will evolve through the genetic technology. The most expectation of the human evolution is to provide the faithful nature for the human being in the world and the nature is the belief of the human being and also it is the life of the human being.

In future, the human evolution will require a directed movement from the large portion of their population for helping the people with more money and the human being to do the work they required. The space colonization is the main one that permits to have the truly global communication system that everybody in the world can operate. Hence the next stage of the human evolution will require the space colonization for the development of the technology and for the favour of human beings in the case of technology.

Possible and probable limitations of the human being

The possible limitations in the human being are cognitive bias, problem in perception, problem in induction, limitation of the senses. The cognitive bias is the limitations of the future human beings. It will lead the problem to the future evolution. It is the deviation pattern that can occur in some situations and also that can lead to the perceptual distortion, inaccurate judgement, <https://assignbuster.com/future-evolution-of-human-beings-philosophy-essay/>

illegal interpretation, and also cause the irrationality to the people. The pattern of deviation is comparing the normal expectations of the future humans and it may be the judgement of human being in external particular situation in the world and can make the complexity to the people. The cognitive bias is evolved with the mental behaviour of the people and it provides the faster decisions for the future people. This complexity decision can make the noise and distortions to the people hence human being mentally affected by these decisions then conflict will be possible among the human beings.

Problem in perception is also the limitation of the people. The perception problem will make the conflict among the people. In future situation, the perception plays the negative role among human beings. In case, in future anyone will provide the wrong information about other one and then this habit will lead the conflict between both of them. The future perception of the people will get misunderstand between them. This is the negative result for the human being in this world. The people's voice, sense, body language in various situations will lead to misunderstand among them and this problem will provide the major negative impact between them on the world. The perception will make the complicated relationship among the human being in future and limitations of the human evolution are toughness.

The future human will be taking the modification of their evolution and transcending the biological limitations through the technology. The modern technologies will be leading the modification in human condition including the cloning, genetic enhancement, robotics, artificial intelligence and the nanotechnology. This modification will lose the capacity in developing these <https://assignbuster.com/future-evolution-of-human-beings-philosophy-essay/>

technological equipments. In future prediction the Transhumanism will raise the spectacular array of possibilities from the super soldiers and the athletes to immortal beings having their brains scanned atom by atom to computers. This is the limitation of the future evolution. This will be the lack of capacity in future evolution.

The technological developments are growing up rapidly. The technological equipments will make the negative effective at the same time to the human evolution. The negative impact of the human evolution can make the heavy problems to the human evolution. The determination of atom will make the heavy negative result to the human being in this world. The future human evolution will be affected by this determination. The man power is the negative impact to the human evolution and this refers the man power will make the man echo from others. This will lead the conflict to the human beings. Due to the conflict of the human being the human evolution will be affected negatively. Hence the administration is also one of the problems in raising the conflict among human being. This is the limitation for the human being.

The population growth is one of limitation for the human evolution in future. The growth of the population makes the negative impact in the development of future human evolution. The increment of the population in the world will make the demand in economics. The economic demand will be making the conflict between the nations for gathering the requirements of people. The lack of requirements will lead to the human being to do illegal actions against governments and also against the society of the people in the world.

This is also the limitation. The human being will be affected negatively by the <https://assignbuster.com/future-evolution-of-human-beings-philosophy-essay/>

technological equipments for destroying the countries for gathering the requirements. The negative outcome will be presented with the low economic things and with low population growth. These are the limitations of the human evolution in future.

In the case of culture, some reflections are impacting the culture on future of human revolution. The human being will be affected by the impact of culture in nation. The culture is the one that differentiates the people according to their country. This differentiation will provide the negative impact to the human being in future. The culture differentiation between the human beings provides the conflict economically, politically as well as socially among the nations. The human evolution of the culture is affected by the migration of the human beings from one nation to other nation. The migration of the human being makes the heavy conflict between the people in on nation to other nation by the differentiation in the culture. So the cultural factors including genetic variation between the people, heritage, belief, environments will provide the negative impact to the future evolution of human beings.

The positive outcomes are in the future evolutions technologically improved at the same time. The technology will be developed in future than the current time. The new production and services of the industries are rising day by day. The contribution of the human evolution is necessary in developing the science and artificial structures. The positive stages are making the human being to develop and at the same time the negative consequences are making the human evolution to destroy. The fact is the one that refers the determination of the technical equipments will get <https://assignbuster.com/future-evolution-of-human-beings-philosophy-essay/>

increased and at the same time the reaction of the industrial production will make the negative effects to the evolution of the human in future. The future evolution will be very critical and different when compared to the current time of the evolution.

### Conclusion

The human evolution and the conditions of the future evolution of the human beings were discussed. The prospects of the human evolution in future were described. The possible or probable limitations of the human being in future evolution were detailed. The cultural impact of the future evolution of the human being was examined. The future environments of the human evolution and the their effects were concluded.
