

Electrolysis the one  
who has dark and

**ASSIGN  
BUSTER**

Electrolysis and laser hair removal are the two best methods for permanent hair removal.

These both methods are advantageous for reducing facial hairs which are very annoying as compared to other body parts mostly for women.

**Difference Laser hair removal:** In laser hair removal treatment only, the light skin and dark hair can be treated with good results because it does not give good results for other skin type of hair type. Now a day's improvement is being made in Laser technology to provide good results for those who do not have light skin and dark hairs using the grouping of laser and radio frequency. **Sessions:** As we know that each part of body has a different size and session vary from size to size, usually if we talk about facial area which is small and if we treat eyebrows then it will take about 15 minutes. And for eyebrows sessions will be from four to eight months. **Cost:** Cost vary on the area which is being treated and average cost per visit lies between \$200 - \$400.

**Pain factor:** Laser hair removal treatment only feels like your skin is being broken by a rubber band. Every person has different level of lenience and anxiety. The one who has dark and rough hairs will feel more burn from heat. So, laser hair removal for man like hair removal of beard and mustache area is more painful than of woman's chin or lip. **Side effects** There is some sensitive place at your body which should be treated carefully like eyebrows treatment can be danger if you didn't protect your eyes while treatment.

So, you have to wear some protection for eyes to avoid later issues. There are some protective eyeshields available for use while having treatment of

eyebrows which can be used to avoid such issues. Results of Laser hair removal. Laser hair removal is approved as a permanent hair removal treatment. According to them 40% to 80% of hairs can be reduced using this treatment. For women facial hairs it is not that effective because those hairs are lighter than the other body areas and laser targets the pigment in hair follicle so it does not help that much for facial hair removal. Electrolysis: Electrolysis is the one which can be used by any skin type or hair color.

Because it does not use the tinture in the hair but attacks the hair follicles.

Sessions: It depends on hair follicle because they are treated individually.

Same like laser treatment in electrolysis if we treat eyebrows it will take 15 - 30 minutes and it depends on the technician. And session in this case are 15 - 30.

Cost: In electrolysis the cost depends on the time of the session. There is a \$45 session for 30 minutes if you are having treatment of your facial area which is small like eyebrows.

Pain Factor: Pain factor in electrolysis is less than laser because each follicle has to be treated individually and this is also a fact that every person has its own acceptance to pain. Side effects If electrolysis is not done rightly then your skin gets

discolored. Results Electrolysis is also approved by the FDA as permanent hair removal technique.

This treatment has the best record but not 100% for everyone because every person has different skin type and not 100% useful for everyone.
