Today home lighting is so much more than just about illumination. You can use light not only to create an ambience that echoes your mood but also to add a flavour to your home decor. Your choice of fixtures, lamps and their placement influence the depth and character of a space. By planning your lighting and by following some basic guiding principles, you can create a unique experience. It is a good idea to try out different kinds of lamps to see the various lighting effects created. You need to optimize and combine lighting fixtures that can be controlled to give different lighting conditions. Don't forget to make good use of daylight, but also ensure that stray light from outside does not filter in and spoil the lighting effects you have created. Home Decorative Lighting Collection, <https://assignbuster.com/brighter-homes-inspiring-homes/>

2009/10 — The Basics of Lighting 23 The Basics of Lighting Kitchen: Light here can be both practical and attractive. Aim for brightness and freshness to give a clean look, but ensure you have enough light for tasks like cleaning and chopping. It is also important to have shadow free lighting all over. This should reach all surfaces, not only horizontal work surfaces but also vertical ones so that you can find things kept in cupboards and drawers easily.

Bathrooms: Bathrooms need to be clean, fresh and bright in the mornings. In the evenings, they need to be quiet, relaxing and refreshing. A bathroom needs good general lighting along with local lighting for mirrors. The light near the mirror should not create deep shadows on the face. Hallways, landings and staircases: These areas should be lit up keeping safety in mind.

These areas need to be lit with neutral and soft light as they lead up to important areas in the house. This will ensure that the lighting in these areas will not over power the lighting in the other rooms. Safety and Wiring - You must always ensure that all plugs and sockets are firmly secured. Any sparking in these sockets can be very dangerous and can reduce the lamp life and affect the quality of light. - If you have cables on the floor, make sure they are away from walking areas. Secure cables by coiling them and keeping them out of the way or use cable management systems to ensure they do not hang loose. - Sockets and lamps should be out of the reach of young children. - Avoid having too many plugs in one socket as this could overload the wiring. When installing sockets, you need to plan for multiple plugs for multiple equipments. - All bulbs and fluorescent lamps heat up and need to be well ventilated. Also make sure your lamps are not touching any combustible material. - Never exceed the maximum wattage specified for a lighting fixture. - Change any lights that flicker or are turning black. These

consume more power and emit less light. - Use specified Philips lamps. They are technologically superior and of a high quality. Philips lamps will not only last long, but will provide you with the highest level of performance throughout their life. Using lighting control - You can control the intensity of your lights by using dimmers. These work especially well with tungsten bulbs. - Fluorescent lights need special controllers. Bear this in mind when buying a lamp and check the fixture specifications. Please check if your lamp allows you to control the light intensity and quality. Also check what kind of controls is needed for these lamps. - Some ' Solid State Lights' (LED) can be controlled to change the intensity, switching cycle and colours. Philips LivingColors is such a light. - By using lamp shades with light fittings you can reduce glare, diffuse the light and give direction to a light beam. - Reflectors are used in lighting fixtures to direct the light beam either to a focused spot or to spread it over an area. 24 The Basics of Lighting Some do's and don'ts

- a. You need to use weatherproof lights for bathrooms and the outdoors.
- b. Unlit walls and ceilings will make your rooms look small. Though this can make spaces look cosy, too many unlit surfaces can make the space seem claustrophobic. To avoid this, you can selectively light walls, floors and ceilings to create varying effects.
- c. You should avoid having lights around fans as the shadow of a rotating fan can be distracting and uncomfortable.
