

Data analytics paper week

**ASSIGN
BUSTER**

You can approach data analytics through multiple avenues by using different diverse techniques. The analytics of data is relevant to this week's assignment, because for the past few weeks our team has collected and stored data on Ordain Manufacturing, we now need to analyze the data.

We have been tasked to present the client with a business project that will help enhance their systems/subsystems into a manageable one that flows at Ordain Manufacturing to better serve their customers. Currently they have systems and subsystems covering each department. In order to be an effective manufacturing company they need to integrate their systems for sharing across the company. Ordain needs to track real-time relevant data that's available at one's fingertips, because it allows you better control of your data and help the company to make the best possible decision for further growth and to satisfy their customers.

For companies has been using the analytics of data to reduce cost and drive innovation. Data has now become more available and with the help of technology better to understand through a computer. Stores such as Home Depot, Low's, and Wal-Mart analyze data to tailor products and price markdowns for customers located in certain demographic areas. FedEx uses data on their delivery trucks and planes, to help manage delivery times and traffic for better delivery schedules.

Through the analytics of data we are changing our environment where we live and work. Statistics lead us to believe that we are on the brink of an analyzing revolution. This change will revamp how organizations are managed, along

with the economies in which they operate. Analytics of data is in the pilot seat, for its useful, valuable, and here to stay.
