

A review of anthropologist on mars one case study only

[Business](#)

Trustee's syndrome can be characterized by convulsive tics, by Involuntary Mallory r repetition of others' words or actions, and by the Involuntary or compulsive utterances or curses and obscenities. It also can consist of a constant testing of physical and social boundaries; a relentless, agitated reaction to the environment, a lunging at and sniffing everything around, or a sudden flinging of objects. So, how on earth could a surgeon, who must perform such delicate, precise work have such a disorder?

Well, it's possible, just ask Doctor Carl Bennett from Branford, British Columbia. DRP. Bennett could do anything that any typical person could do.

He could rive, raise a family and be a successful professional. Oliver Sacks quickly found out though that DRP. Bonnet's life was so unbelievably unique because of the amazing fact that he was a full blown torture and also able to perform such great surgery. To study DRP. Bonnet's behavior, Sacks was invited to stay with the Bennett family for months so that he could get the best understanding of how he lived his spectacular life.

Sacks found that DRP.

Bennett would skip on every fifth step when he walked, and suddenly reach to the ground, as if he was picking something up, but yet pick up nothing. He also found that he would have obsessive touching of his glasses and mustache. " His mustache had to be constantly smoothed and checked for symmetry , his glasses had to be ' balanced' -up and down, side to side, diagonally , in and out – with sudden, tick touching of the fingers, until these, too were exactly ' centered'. "(81 Sacks) While Sacks stayed with DRP.

Bennett he learned that Bennett was an adopted child leaving him unaware if anyone in his family had this syndrome as well.

The behavior genetics, as we spoke of in class, of this pattern can not be determined well because he did not ever know his parents. Since forty to sixty percent of all behavior is related to genetics, it is a very good possibility that Bonnet's family carried the trait as well. Although he had all these abnormalities, he made up for them in the operating room. While the DRP. Loud "scrub up", Sacks noticed that he made the same talking, jolting motions, and shouting as always, but as soon as he got down to business, he changed.

Not one tick during the whole surgery and the surgery lasted for two and one half hours. DRP. Bennett claims Tanat Wendell is performing surgery. It never even runs through his mind that he has trust syndrome. He claims that, "His whole identity at such time is that of a surgeon at work and his entire psychic and neural organization becomes aligned with this, becomes active, focused, at ease, UN-diuretic. (96 Sacks)
