

Hearing maintenance will extend the life of your

[Finance](#), [Investment](#)

Hearing aids are designed to provide many years of dependable service, but it's inevitable that they occasionally experience problems. Your hearing aids are used daily in a harsh environment, subject to moisture, heat and earwax.

Regular maintenance will extend the life of your investment and help prevent costly repairs and early replacement. The most important preventative maintenance step you can take is to clean your hearing aids every day. Use a dry, soft cloth to wipe down your devices. Don't use water, solvents, alcohol or cleaning fluids – all can damage your hearing aids. After you remove your hearing aids, store them in a case to avoid contact with dust and dirt. Sometimes, problems might still occur. Many can be resolved at home, while others require a hearing service technician. Try to fix the following common issues, or contact Creekside Hearing Aid Service for professional help: Hearing aids are not producing sound.

Often, this indicates a dead battery or a clogged sound outlet. Try cleaning the sound outlet, replacing the wax filter and replacing the battery. Hearing aids produce feedback. Sometimes, this issue is as simple as an improperly inserted hearing device. Try removing and reinserting your hearing aids. If this doesn't help, earwax might be to blame. Try changing the wax filter.

The sound is unclear or distorted. Dirty contacts or a corroded battery often causes distortion. Wipe down the contact points and battery surfaces – if this doesn't do the trick, replace the battery.

When these troubleshooting tips don't solve the problem, bring your hearing aids into the Creekside office for repair. Our staff performs routine maintenance as part of the Total Listening Care (TLC) Program. This is a
