Today we are going to discuss about scientific literature, it is actually the way to represent the research, by help of this many experts, scholars, philosopher etc communicate with each other by introducing some new research on any part of their related field. By the help of this researchers convey their research to world.

The Basic types of scientific literature are primary literature and secondary literature.

First of all we will discuss about Primary literature: Primary literature is basically Original research means (no notes) which is done by researchers in their individual fields is called primary literature. These literatures are done in two ways, one is done individually and other is done in the form of groups. It is further categorize in to several types one is Journal Articles papers: It is the permanent and transparent form of representation it is basically represent by two ways one is called peer review means (your contemporaries) in this type the paper are check first then published paper are check by experts and written by experts and approved by an expert the experts are your contemporaries, second one is called not peer review paper which are not check by any one experts and directly published. Articles papers: Are also of many types from which one is short paper called short communication is something we called very exciting breakthrough. The rapid communication comes in it with the help of this communication researchers do communicate something immediately will share new research quickly.

The Review paper are the paper which contain long paper which is more technical is called Review paper.

Review report are different from review paper because both are different formats in review reports we discuss about highlights Practical aspects. Also papers are written for conferences is called conference proceeding papers. The book which is given when registering of conference is done this is also form of paper/abstract and called extended abstracts it is small paper consist of two pages

normally.

Dissertation

In normal language we called it thesis like MS thesis PHD thesis, explanatory thesis etc. one type of thesis which contain 60 to 100 pages basically these pages are introduction pages based on multiple research paper may be of 8 or more this is called one idea and normally used in western countries in other hand Manuscript is another type of thesis, it is in the form of book may be of 800 pages and more or less.

**Pictorial Abstract** Know a days the abstract are conceits of picture the research represent the results with the help of pictures it may be in the form of graph is called graphical Abstract or pictorial abstracts. The abstracts are also in the form of video's some abstracts are done in the form of videos, the research record the abstracts in the form of videos and send is called videos abstracts. Videos are also of many types one of them is in the form of interview but the interview should be of expert only . also video conference is done in business meetings at high level, done between executives and due to their expertise, the business forecasting is done which is purely base research and very important for an organization .

**Magazine Paper :** These are the papers through which results are published immediate printed in magazine are called

magazinepapers.

Patent : Is also one type of representing the research papers , the patents are of three types Utility patent, design patent and plant patent. M

Mobile Tablets : This is also another type to represent the scientific literature like WhatsApp through this they can communicate with expert researchers for their research .

Media : It is also the way to carry out the research it is also very helpful to get information

.

Primary literature: Have many more characteristics , there are many more different ways to represent research papers in primary literature.

The abstract/papers are also represent in more different ways , basically the research depend upon results . The technology is changing day by day so one way of research is to represent references so further research will be done.

There is one section in which researchers easily help each other by identifying their mistakes or do concert with experts to get good and valuable feedback which help them to do research in more result oriented and this section is called Discussion section.

SECONDARY RESEARCH: This is the second way to represent the research papers/abstracts this research is consist of paper. It is represent by many ways from which some are in the form of text book, newspaper , magazines, internet etc. Textbook: In this the papers abstracts are written in the form of Text book, these types of abstract are commonly and mostly used and more helpful in future research. This type of Research are commonly

used by many students to get more information about particular topic.

Internet: It is the most common and easiest tool of scientific literature which give so many different platforms such as Wikipedia, Facebook, LinkedIn and many more. Wikipedia is basically the website of social media this is the platform which give opportunity to researchers to share their research immediately and this platform is free of cost in this platform the research is checked and verified by experts then published. Facebook is also another platform to publish the paper but the papers are published without any checking.

LinkedIn is also the platform which is helpful for researchers to contact with a certain person regarding research. Many more ways to represent research is covered by Internet. It is a vast field and introducing new ways day by day. Magazines: It is also the way to represent research paper it covers both in primary and secondary research the basic difference is if it represents pure research then comes in primary research otherwise secondary research.

Newspaper: It is also the type by which research papers are published, the news papers play an important role to collect information which is helpful for new research. Also 'newsletter' regularly published collection of articles which are done by many experts which is very helpful to collect data.

Media shows: It is also the way to represent the literature in this many experts sit together or on conference call and do the discussion and try to give their opinion about the topic which is. There are also many more different things to represent secondary research. In a nutshell there are many different ways to represent scientific literature here we discuss only two ways one is primary literature which is based on pure research represent

in the form of journal paper, Reviewpaper, review reports, conference proceeding papers, extended abstractdissertation/thesis, manuscript , patentand videos recording.

Other one is secondary literature which is based on notpure research also represented In the form of newspaper, text book, magazines, internet etc.
