Warehouse Management Case Study:

Warehouse management is the process of the organization of storage and transportation of goods and automation and optimization of this process. Every business depends on the quality of warehouse management greatly, because the process embraces also such aspects as sale, price of goods, the speed of their delivery and the quality of their storage. It is obvious that goods should be moved somewhere after production at a plant or a factory and a warehouse is the right place. Evidently, every warehouse should be equipped properly in order to store goods in the right order, as different products require different manner of keeping.

The quality of warehouse management can be observed on the example of the speed of transportation of goods to the customer. When there is the order, a good salesman guarantees fast on time delivery, which depends on the organization of the warehouse. There should be a plan, inventory list and classification of goods into the certain classes according to their price and importance. Furthermore, in order to organize high-quality tracking the manager should be aware of the type of transportation, the point of destination, the delivery terms, etc. In order to make the process of warehouse management better a system of warehouse management is created. The computerized system enables to manage the structure and the work of warehouse well and make its work faster, easier and cheaper.

For example, with the help of warehouse management system it is easy to use the place of warehouse wisely, find the direct location of goods in the warehouse at a moment's notice, etc. It is important to learn about

warehouse management as much as possible to be aware about the processes of storage and transportation of various goods and the factors which influence these processes.
